

# Dominion AI

## A Plain-English Manual

Every button, every screen, explained for someone brand new. You do not need to know anything about computers to use this.

---

## What this app is

---

Dominion AI is an app you talk to. You type (or speak), and it answers. It can also do real work for you: make pictures, create Word and PDF documents, and even build working apps on your computer. This manual walks you through it one screen at a time.

## First, one word: 'model'

---

A **model** is the 'brain' that reads what you type and writes back. There are many of them, made by different companies. Some are faster, some think harder, some can look at pictures. You can choose which one answers you, but here is the most important thing in this whole manual: **you never have to change anything**. A sensible model is always chosen for you. Every setting in this app already has a good default. Change things only if you want to.

## Moving between screens: the compass

---

There are four screens. At the bottom of the chat is a small round handle called the **compass**. **Press it** and a menu pops up with a big button for every screen: Chat, Forge Dial, Image Maker, and App Builder. Tap one to go there. To come back, press the compass again or the back arrow. If you are ever lost, press the compass.

### Four golden rules (the whole app in four lines)

- You never *have* to change a setting. Good defaults are always picked for you.
- Lost? Press the compass. It lists every screen.
- It always asks before spending real money.
- Your pictures and chats belong to you.

# 1. The Main Screen (Chat)

---

*This is home. You type a message; it answers. Everything else is optional.*

## **The message box and Send**

**What it does:** Where you talk to the assistant.

**How:** Type your message in the box at the bottom and press send (or the Enter key). That is the entire basic use of the app.

## **Voice (microphone and speaker)**

**What it does:** Talk instead of type, and have answers read out loud.

**How:** Tap the microphone, speak, tap it again to send. Tap the speaker to have every answer read aloud.

## **Attachments (the paperclip)**

**What it does:** Send photos, PDFs, Word documents, spreadsheets, and text files into the chat so the assistant can read them.

**How:** Tap the paperclip and pick your files. A photo of a document is read automatically.

## **Model, Mode, and Privacy (three controls at the top, by the Dominion name)**

**What it does:** Which brain answers, how it works, and where your words may go. All three have good defaults; you can ignore them.

**How:** **Model** is which brain (a wrench icon means it can do tasks, a speech bubble means it only talks, an eye means it can see pictures). **Mode** is how it works (Normal is fine for almost everything). **Privacy** is how private to keep things (Normal is the default).

## **Documents and downloads**

**What it does:** Turns a conversation into a real Word, PDF, Excel, or CSV file.

**How:** Just ask, for example 'make that a Word document' or 'turn this into a PDF.' A Download button appears under the answer; tap it to save the file.

## **Artifacts (the document button, top)**

**What it does:** Your library of every document the assistant has made, kept with full history.

**How:** Open it from the top. Each document can be reopened and downloaded again in any format.

## **Memory (the memory button, top)**

**What it does:** Facts and preferences the assistant remembers about you between conversations.

**How:** Ask it to remember something, or add a fact yourself. You approve, edit, or delete anything it keeps.

## **Tool activity (the tools button, top)**

**What it does:** A record of every action the assistant took, if you ever want to see what it did.

**How:** Open it from the top, or tap the small tool line under any answer.

## **Mentor (the mentor button, top)**

**What it does:** An independent second opinion on an answer.

**How:** Tap Critique on any answer to get a review of it.

## **Chats across your devices**

**What it does:** Your conversations follow you between phone and computer, by themselves.

**How:** Nothing to do. Start on your phone, continue on your computer. Deleting a chat removes it everywhere.

### **The conversation sidebar (the menu button)**

**What it does:** Your list of past chats, and where you start a new one.

**How:** Open the menu. The bright green 'Start a New Conversation or Project' button at the top begins a fresh chat.

### **Setup (bottom of the sidebar)**

**What it does:** Your account, your credits and payment, and connections to other services (like GitHub).

**How:** Open the menu, then Setup at the bottom.

## 2. The Forge Dial (the flame button)

---

*Two simple settings for how the assistant works. Open it with the flame in the message bar, or from the compass.*

### **Effort: Ember, Flame, Furnace**

**What it does:** How hard the assistant thinks. Thinking harder is slower and costs a little more.

**How:** **Ember** is the everyday setting (quick and cheap). **Flame** thinks more. **Furnace** thinks the hardest. Ember is a fine default for most things.

### **Forge Mode (a switch)**

**What it does:** Turns on the assistant's ability to actually DO things (use its tools and take action), instead of only talking.

**How:** Leave it off for normal conversation. Turn it on when you want it to go do a task for you.

### **Leaving the dial**

**What it does:** Returns you to the chat.

**How:** Tap Seal Setting, the back arrow, or the compass. Your choice is remembered.

## 3. The Image Maker (the picture button)

---

*Describe a picture and it makes one. Open it with the picture button in the message bar, or from the compass.*

### **What to make (the box) and Ignite the Forge (the big button)**

**What it does:** You describe a picture; the button makes it. This is all you need.

**How:** Type what you want, for example 'a bulldog wearing a hard hat,' then press **Ignite the Forge**, right below the box. Everything under it is optional.

### **Refine**

**What it does:** Rewrites a rough idea into a fuller description for you.

**How:** Type a few words, tap Refine, and it fills out the description.

### **Quality and Shape**

**What it does:** Optional looks: how detailed the picture is, and whether it is square, tall, or wide.

**How:** Leave them alone for good defaults, or tap to change. The screen shows the price for your choices.

### **Make several at once (a switch)**

**What it does:** Optional. Makes several pictures at half price within a day instead of one right now.

**How:** Turn it on, add your descriptions, and send the batch. You are charged when you send it.

### **Add your own images**

**What it does:** Optional. Add your own pictures and it copies their look.

**How:** Add up to 10 of your own images before you forge.

### **Your Forged Visions (the gallery)**

**What it does:** Where finished pictures land. They are saved on your own device, not in the cloud.

**How:** Open, favorite, search, or download any picture from the gallery.

## 4. The App Builder (open the compass, choose App Builder)

---

*The most powerful screen. Describe an app you want, and it builds a real, working one on your computer.*

### How to open it

**What it does:** Takes you to the building screen.

**How:** Press the compass and choose App Builder (or drag the compass upward).

### Three modes (choose once, change anytime)

**What it does:** How much you see. Beginner is one simple conversation; the other two show more optional controls.

**How:** Pick **Beginner**. It greets you, you say what you want, it asks a few questions, and it builds, even making the app's folder for you. (Vibe coder and Software engineer are the same thing with more buttons showing.)

### The conversation and 'build it'

**What it does:** You describe your app in plain words; it asks questions until it understands, then builds.

**How:** Type what you want to build. It asks one thing at a time, then shows the plan as simple bullets. Say 'build it' (or 'yes,' 'go ahead') to start.

### If your computer is not connected yet

**What it does:** The app needs your computer to build on. It walks you through connecting.

**How:** It explains how to connect and keeps the conversation going, then picks up right where you left off, without making you repeat yourself.

### The journey rail (top of the screen)

**What it does:** Shows where you are, in six steps, from 'Shape the idea' to 'Use it or share it.'

**How:** Nothing to tap. The lit step is now; it moves by itself as you go.

### Blueprint and Workshop (two tabs)

**What it does:** Two views of your build: the plan, and the finished thing.

**How:** **Blueprint** is the numbered plan. **Workshop** is where you try the finished app, see the checks that passed, and view the code if you are curious.

### Safety and budgets (automatic)

**What it does:** It protects your computer and your money without you doing anything.

**How:** It makes a save point before changing anything, never touches protected folders, and stops to ask before spending too much. A build keeps running even if you close the app, and notifies you when it is done or needs you.

### Start fresh

**What it does:** Throws away the current build and starts over, in one tap.

**How:** Tap Start fresh in the conversation header. Anything already running is left alone.

### Build log

**What it does:** Your past builds.

**How:** Open it from the header; tap an old build to replay its whole story.

### **Start from a plan**

**What it does:** Turns a plan you made in the main Chat into a real project here.

**How:** In the App Builder, open 'Start from a plan,' pick your saved plan, name the project, and build.

### **The crew window (for the curious, never required)**

**What it does:** Lets an advanced user hand-pick which AI does each task and how many helpers work on it, with live time and cost shown.

**How:** Beginners never need to open this. Everything works without it.

## 5. How the screens work together

---

*Most features live on one screen, but a few connect them.*

- **The compass** ties all four screens together, so you never get lost.
- **A plan** you talk through in the main Chat can be saved and sent to the App Builder to become a real project.
- **Documents** you ask for in Chat are kept in Artifacts, ready to reopen or download again.
- **Big requests** in Chat ('review this whole thing,' 'write ten chapters') can become long jobs that run for hours in the background and notify you when done. It tells you the cost first and never runs the bill away.
- **The Forge Dial's** Effort and Forge Mode settings apply to the assistant everywhere.

### **If you remember nothing else**

- Type what you want, in plain words. That is the app.
- Press the compass to reach any screen.
- You never have to touch a setting; the defaults are already good.
- It always asks before it spends money, and your work is yours.
